NEWS RELEASE

TRADING SYMBOL: CUI

Date: October 2, 2003

DRILL RESULTS AT SCADDING GOLD PROPERTY

Currie Rose Resources Inc. has been informed by the Company's joint venture partner of the following drill results on the Scadding gold property.

Drill holes JML03-01 and JML03-02 have now been sampled and assay results are tabulated below:

<u>Drillhole</u>	Intersection from - to	Interval Meters	Gold grade in Grams/tonne
JML-01*	10.5 - 15.5	5.0	5.5
includes	13.0 - 15.0	2.0	10.7
includes	14.0 - 15.0	1.0	13.1
	30.0 - 34.0	4.0	1.9
includes	30.0 - 31.0	1.0	5.4
	41.0 - 47.5	6.5	3.3
includes	41.0 - 44.0	3.0	5.8
includes	41.0 - 42.5	1.5	10.1
includes	42.0 - 42.5	0.5	22.7
JML-02**	18.2 - 19.0	0.8	2.3
	40.5 - 47.5	7.0	9.1
includes	44.5 - 47.5	3.0	20.1
includes	46.0 - 47.0	1.5	33.7

* Confirmation of Currie Rose drillhole CR-2 Both drillholes contained visible gold in core.
** Width of JML-02 represents estimated true width

Five (5) stratigraphic drill holes along a north-south fence have now been completed at the North Zone Target Area, one of four known gold occurrences at the Property. Drilling is adjacent to an east-west trending open cut where gold was mined to a depth of 7 meters. Each hole is approximately 100 meters in length, and is

designed to test the existence, continuity and grade of gold in the chlorite-rich zones. The fence of south holes currently being drilled will determine the thickness of the host stratigraphy associated with the North Target Area.

“ Exploration at Scadding represents a unique opportunity to systematically explore a series of gold bearing systems with unknown extent. ” said Ken Lapierre the President of JML. “ The high grade nature of gold occurrences on the property is encouraging. Our objectives of the first phase program include confirming the controls to gold mineralization and defining limits of the gold bearing stratigraphy at the North Target Area. ”

The Company has currently submitted core samples to the assay laboratory for analysis using a combination of fire assay and total pulp metallic assay techniques. A system of check assay analysis will be implemented for the current phase of the drill program. Drill core is kept under the custody of JML personnel and after drilling is transported to the JML field office in Sudbury, Ontario. The core is logged, saw-split and sent for assay to Expert Laboratories in Rouyn-Noranda. Check assays will be submitted to an ISO accredited laboratory for analysis. The drill program is being conducted under the supervision of Ken Lapierre P.Geol the Q.P. for JML Resources Ltd.

ON BEHALF OF THE BOARD OF DIRECTORS
