NEWS RELEASE

Trading Symbol: CUI.V

Date: April 22, 2004

Currie Rose Resources Inc. has been informed by the Company's joint venture partner, JML Resources Ltd., of the completion of a reconnaissance drilling program at the Scadding Gold Property located near Sudbury, Ontario. Drilling since January 2004 has identified three new zones of gold mineralization at the property. These included the two new zones of mineralization outlined in the JML press release of March 4, 2004 and the newly discovered 16 Zone. A follow-up program on the 16 Zone and other priority targets is scheduled to commence mid-May after spring breakup.

16 Zone –new discovery

Hole JS04-16 was centered on a 250 meter long, previously untested induced polarization anomaly located west of the Central Zone where reported historical production of 115,000 tons @ 0.21 ounces/ton occurred in the mid 1980s. The results from hole16 are tabulated below:

Hole #	Intersection (m)	Width-m (ft)	Gold-g/t(o/t)	Comments
JS04-16	160-174	14.0 (46.0)	3.13 (0.09)	Zone 16
Including interval	161-165	4.0 (13.1)	5.39 (0.16)	“
Including interval	163-165	2.0 (6.6)	9.08 (0.26)	“
Including interval	171-174	3.0 (9.9)	6.75 (0.19)	“
Including interval	172-173	1.0 (3.3)	10.32(0.30)	“

m=meters, ft=feet, g/t=grams/tonne, o/t=ounces/ton

Zone 16 is a brecciated zone of chlorite and albite alteration containing from 1 - 5% pyrite and visible gold which is similar to the description of the host rock from historical production from the Central Zone.

17 Zone -new discovery

Hole JS04-17 intersected a previously untested zone of intense chlorite and albite alteration associated with pyrite and visible gold. The results from hole17 are tabulated below.

Hole #	Intersection (meters)	Apparent Width (meters)	Au-g/t
JS04-17	30.3-33.3	3.0	23.00
Including interval	30.3-31.1	0.8	45.19
Including interval	31.9-33.3	1.2	20.57

Assays were completed at Laboratoire Expert Inc. in Rouyn-Noranda Quebec using conventional assay techniques.

The high grade nature of the gold mineralization and width of the zone is encouraging and will be followed up with additional drill holes to determine the potential of the 17 Zone.

Zone 2

Three holes tested approximately a 200 meter strike length of a previously untested induced polarization anomaly. All holes intersected the albitized rich halo associated with gold mineralization. Hole JS04-15 intersected a narrow zone of intense brecciation, albite and chlorite alteration with pyrite and visible gold. A one (1) meter (3.28 feet) section of the zone assayed 4.64 g/t (0.13o/t).

Historical Gold Zones

In addition to the above noted gold zones there are two historical gold zones with excellent upside potential to host additional concentrations of gold. The North and East-West Zones were drilled and open pitted by previous operators and were preliminary drilled (11 holes) by JML in 2003. Results identified significant gold associated within several areas of intense chlorite-rich breccia associated with pyrite and visible gold.

“The recent phase of drilling at the Scadding Gold Property has indentified several high priority areas for follow up which have encouraging grades in drill core”, said Ken Lapierre, President of JML. “The next phase of drilling will focus on testing the continuity of the gold mineralization in several of the most prospective zones.”

Ken Lapierre P.Geo. is the qualified person of JML Resources Ltd and is responsible for the contents of this release.
